The ChatGPT created a good pizza with shapes, however, all of the movement on screen is not done visually. Instead, when the page is opened, keys are pressed, or the mouse is clicked, shapes will simply change positions instantly without movement. The pizza is also very small compared to the background, the cheese and crust have a very small distance limit, and the text in the bottom right that lets you know who made it is cut off. As for what I created with p5.js, I made the cheese and crust visually move and stop at random locations on the screen, with a high range of potential locations to move to. The sauce visually moves according to the user's inputs on the W, A, S and D keys. Clicking the screen will instantly move the cheese and crust back to where they started from before moving to new random positions and the entire pizza makes up a majority of the screen, with the title of the work in the top left and my name in the bottom right.
